Direction to recall additional infant formula products due to presence of cereulide toxin

17 Jan 2026

- 1Following our direction to stop sale of five infant formula products on [8 Jan 2026](#), the Singapore Food Agency (SFA) has stepped up surveillance and testing of infant formula products.
- 2SFA has detected cereulide toxin in two additional infant formula products. These products may have used the same raw ingredient supplied by the same source used in the earlier batches of implicated infant formula products. As a precautionary measure while SFA’s investigations are ongoing, SFA has issued a direction to recall these products:

S/N	Product name	Packaging Size	Batch number	Expiry date	Country of origin
1	Nestle NAN HA1 SupremePro	800g	52340017C3	31/08/27	Switzerland
2	Dumex Dulac 1	800g	101570778C	03/09/27	Thailand

- 3Additionally, SFA has confirmed that a Singapore-based manufacturer, SMC Nutrition, had used the same raw ingredient in some of their infant formula products meant for export. We have directed SMC Nutrition to stop the export of the affected products and notified the competent authority of the importing country.
- 4There is one case who had consumed the affected product with mild symptoms likely associated with cereulide exposure. The case has since recovered. Currently, there are no definitive clinical laboratory tests to confirm cereulide poisoning. The Communicable Diseases Agency is working closely with SFA and is conducting surveillance with medical practitioners to monitor for potential cases of cereulide poisoning in children.
- 5Cereulide is a toxin produced by some strains of Bacillus cereus bacterium, which can cause symptoms such as nausea, vomiting, abdominal cramps, and diarrhoea. The symptoms, which typically appear between 30 minutes to six hours from consumption of an affected food item, will usually resolve within 24 hours. Vulnerable populations, such as infants and immunocompromised persons, are at higher risk for complications.
- 6The implicated batches of imported infant formula products make up less than five per cent of our imported supply of infant formula products. They are a minority of the diversity of infant formula products in Singapore. SFA will continue to engage importers and manufacturers to monitor the situation closely.
- 7Consumers who have purchased the affected products are advised not to feed them to their children. Those whose children have consumed these products and are unwell should seek medical advice promptly. Consumers may contact their point of purchase for product enquiries.
